# Base station wireless communication solution

What is a base station in a wireless network?

An integral part of a wireless communication network, a base station (often known as a repeater) enhances the radio coverage and reliability of a system. It is a fixed transceiver that connects one or more wireless networks for communication purposes, capable of sending and receiving wireless signals.

What is a mobile base station?

A mobile base station, also called a base transceiver station (BTS), is a fixed radio transceiver in any mobile communication network or wide area network (WAN). The base station connects mobile devices to the network and routes them to other terminals in the network or to the core network of a mobile operator...[Read more Explore Mobile base...](#)

Why are base stations important?

Base stations are the backbone of wireless communication networks, playing a pivotal role in signal transmission, network reliability, and high-speed data connectivity. As technology evolves, the importance of base stations will continue to grow, addressing new challenges and supporting the ever-expanding demand for wireless communication services.

What is a passive IS-integrated base station?

In particular, integrating passive IS into the base station (BS) is a novel solution to enhance the wireless network throughput and coverage, both cost-effectively and energy-efficiently. In this article, we provide an overview of IS-integrated BSs for wireless networks.
