
Bosnia and Herzegovina Super Double Layer Capacitor

What are electric double layer capacitors?

Electric double layer capacitors represent a hybrid solution between fast-acting capacitors and energy-dense batteries. By leveraging physical ion storage and the large surface area of activated carbon, they enable rapid charge/discharge, long cycle life, and wide application in modern electronics and energy systems.

What is a hybrid supercapacitor?

Hybrid or asymmetric supercapacitors are another form of supercapacitor in which anode selection often involves carbon material-based electrodes, whereas cathode selection typically involves redox reaction-based electrodes.

What are electric double-layer capacitors (EDLCs)?

Electric double-layer capacitors (EDLCs) are devices based on Carbon/Carbon-based electrodes and have the characteristics of being charged and discharged very fast (within seconds) and can therefore be used where high power is required. Despite the high-power capability, these devices have limitations in energy density.

What is a supercapacitor?

The type of supercapacitor (SC) is determined by the material used to fabricate the electrode. Generally, if carbon-based material is used, it falls into the category of electric double-layer capacitor (EDLC). For Transition metal oxides, MXene, MOFs or conducting polymers, etc., it falls into the pseudocapacitance category.
