
D2D communication of solar base stations

What is communication in D2D?

The communication in D2D defines the direct communication technology among two cellular systems without subjecting via the base station. This assists to tune some cellular traffic to the D2D frameworks, improving the capacity of the network, enhancing the efficacy of spectrum, decreasing the latency, and scaling coverage [8].

How does resource sharing affect D2d Network Sustainability?

However, resource sharing between relay-based and cellular D2D connections often results in mutual interferences, reducing the system sum rate. Moreover, traditional relay nodes consume their own energy to support D2D communication without gaining any benefit, affecting network sustainability.

Why do we need scalable D2d network optimization solutions?

There is a requirement to address the limitations encountered by dynamic network conditions, such as varying channel conditions and user mobility, in the joint optimization process. Research is needed to develop scalable solutions that can handle a large number of D2D users and optimize resource allocation and relay selection in such scenarios.

Do traditional relay nodes consume their own energy to support D2D communication?

Moreover, traditional relay nodes consume their own energy to support D2D communication without gaining any benefit, affecting network sustainability. To address these challenges, this work proposes an efficient relay selection and resource allocation using the novel hybrid manta ray foraging with chef-based optimization (HMRFCO).

Aiming at the problem of D2D communication mode selection and resource optimization under the joint resource allocation mode in 5G ...

This study analyzes the performance of Device-to-Device (D2D) communication in drone-assisted cellular networks, focusing on ...

Several companies, including Japan's NTT Docomo, will develop direct-to-device (D2D) mobile services, delivered via a space-based non-terrestrial network (NTN) using high ...

Resource Sharing and Offloading: D2D communication can aid in offloading data traffic from the cellular network, especially in congested ...

Abstract--Device-to-device (D2D) where users communicate directly with each other with limited base station involvement can significantly improve spectral efficiency, energy ...

D2D communication allows communication between two devices, without the participation of the Base Station (BS), or the evolved NodeB (eNB). Proximate devices can ...

The incorporation of device-to-device (D2D) communication, utilizing the same spectral resources as cellular networks, is regarded as a pivotal development for the next ...

The first step to establishing a D2D session is device discovery; an efficient device discovery will lead to efficient D2D communication. D2D device further needs to manage its ...

The introduction of D2D communication offers a significant opportunity to improve the efficiency and

capacity of wireless networks. D2D communication allows for direct ...

Abstract--In this paper, we investigate secure device-to-device (D2D) communication in energy harvesting large-scale cognitive cellular networks. The energy ...

This page covers the advantages and disadvantages of D2D (Device-to-Device) communication used in LTE and 5G NR. It outlines the benefits ...

Among the many innovations that 5G brings to the table, one stands out prominently--Device-to-Device (D2D) communication. D2D communication introduces the ...
