# Do solar panels generate electricity or store electricity

Do solar panels store energy?

Understand that solar panels capture sunlight and convert it into electricity, but they do not inherently store the energy they generate. To store solar power for later use, you'll need to integrate a separate energy storage system, such as battery banks or grid-tied systems with net metering.

How does solar energy work?

The amount of sunlight that strikes the earth's surface in an hour and a half is enough to handle the entire world's energy consumption for a full year. Solar technologies convert sunlight into electrical energy either through photovoltaic (PV) panels or through mirrors that concentrate solar radiation.

Why do we need solar panels & energy storage?

Understanding solar panels and energy storage is essential in the transition to clean energy. These technologies reduce greenhouse gas emissions, promote energy independence, create jobs, and contribute to various sectors, including agriculture. Solar panels harness solar energy to power homes and businesses.

How do solar panels generate electricity?

This process is constant. Over 500 million tons of hydrogen atoms are converted into helium every second, resulting in photons that generate solar energy here on Earth. In a nutshell, solar panels generate electricity when photons (those particles of sunlight we discussed before) hit solar cells. The process is called the photovoltaic effect.
