
Does the mobile box transformer need power

Why do we need transformer substations?

The substation is currently transforming an installed power of 5,080 kVA from low to medium voltage in order to power the machinery running in the mine. The need to employ transformer substations is of vital importance to the mine, as the general grid cannot cope with the peaks of demand of the heavy machinery used in such projects.

What is a mobile transformer?

Even with the use of emergency generation, small mobile transformers may be called upon to adjust voltages in the area, or to mitigate prolonged disruption. A mobile substation, or MTS, is designed to bring electricity temporarily to areas that have lost it. They are used during war, natural catastrophe or an equipment breakdown.

How many mobile transformers are there?

High-side voltages range from 35 to 245 kV with sizes ranging from 5 MVA to 100 MVA. Estimates by transformer manufacturers indicate that there are roughly 500 to 600 mobile transformers in service (slightly greater than 1% of the medium-power transformer inventory).

How many generators can be connected to a transformer substation?

Connection of up to 4 generators directly to the substation makes it possible to considerably optimize the work space. In those cases where space is considered an important disadvantage, the option of a mobile transformer substation is the perfect solution. Do you want to know more about our transformer substations?
