Are zinc-bromine flow batteries suitable for large-scale energy storage?

Zinc-bromine flow batteries (ZBFBs) offer great potential for large-scale energy storage owing to the inherent high energy density and low cost. However, practical applications of this technology are hindered by low power density and short cycle life, mainly due to large polarization and non-uniform zinc deposition.

Are aqueous zinc-bromine batteries a viable solution for next-generation energy storage?

Aqueous zinc-bromine batteries (ZBBs) have attracted considerable interest as a viable solution for next-generation energy storage, due to their high theoretical energy density, material abundance, and inherent safety. In contrast to conventional aqueous batteries constrained by sluggish ion diffusion through

What are zinc-bromine flow batteries?

In particular, zinc-bromine flow batteries (ZBFBs) have attracted considerable interest due to the high theoretical energy density of up to 440 Wh kg⁻¹ and use of low-cost and abundant active materials [10, 11].

Are aqueous zinc-bromine single-flow batteries viable?

Learn more. Aqueous zinc-bromine single-flow batteries (ZBSFBs) are highly promising for distributed energy storage systems due to their safety, low cost, and relatively high energy density. However, the limited operational lifespan of ZBSFBs poses a significant barrier to their large-scale commercial viability.
