
Functional requirements of portable energy storage power supply

What is a flexible energy storage powers system (fesps)?

In view of the aforementioned shortcomings, a flexible energy storage powers system (FESPS), featuring dual functions of power flow regulation and energy storage on the basis of the energy-sharing concept, has been proposed in this paper.

Should energy storage power stations be scaled?

In addition, by leveraging the scaling benefits of power stations, the investment cost per unit of energy storage can be reduced to a value lower than that of the user's investment for the distributed energy storage system, thereby reducing the total construction cost of energy storage power stations and shortening the investment payback period.

What are the limitations of a distributed power generation system?

In addition, the operation of equipment for distributed power generation is limited by the energy consumption, external environment, and other constraints, resulting in an idle or redundant energy supply capacity.

When does the energy storage system choose not to discharge?

When the grid price is in the valley period, such as 15:00-18:00, the energy storage system chooses not to discharge regardless of the power shortage. Thereafter, the energy storage system initiates the discharging mechanism when the grid price is in the peak period starting period of 18:00.
