
Long-term energy storage on the grid side

How long does a grid need to store electricity?

First, our results suggest to industry and grid planners that the cost-effective duration for storage is closely tied to the grid's generation mix. Solar-dominant grids tend to need 6-to-8-h storage while wind-dominant grids have a greater need for 10-to-20-h storage.

Does energy storage provide grid services?

Fig. 3 uses observed load and generation data from the California Independent System Operator (CAISO) to illustrate the various grid services that energy storage can provide, particularly as the amount of variable generation on the grid increases.
