How to optimize base station deployment in 5G wireless networks?

In previous research on 5 G wireless networks, the optimization of base station deployment primarily relied on human expertise, simulation software, and algorithmic optimization.

How can a 5G cellular network be developed?

The developed model can facilitate the rollout of 5G technology. Due to the high propagation loss and blockage-sensitive characteristics of millimeter waves (mmWaves), constructing fifth-generation (5G) cellular networks involves deploying ultra-dense base stations (BSs) to achieve satisfactory communication service coverage.

What is the location optimization approach for 5G BS?

The location optimization approach for 5G BSs aims to cover the service demand area with the minimum number of BSs or to maximize the service coverage area of a given number of BSs. To solve this typical coverage problem,an MCLP modelwas employed for the location optimization of 5G BSs.

Should 5G base stations be tripled?

To cover the same area as traditional cellular networks (2G,3G,and 4G),the number of 5G base stations (BSs) could be tripled(Wang et al.,2014). Furthermore,Ge,Tu,Mao,Wang,and Han,(2016) suggested that to achieve seamless coverage services,the density of 5G BSs would reach 40-50 BSs/km².
