## Spanish grid-connected inverter quality

What is the difference between Spanish Grid Code and new grid code?

there are significant differences between the previous Spanish grid code and the new one. The previous grid code only included the technical requirement for assessing power plants responses under voltage dips -or FRT capability, and only required the facility to remain connected to the network during the

What is a grid connected inverter?

The grid-connected inverter employed is a micro-inverter (module inverter) designed for small outputs of about 200 W. It has an in-built maximum power point tracking (MPPT) function. The switch-on voltage of the inverter is 35 V, and the MPP voltage tracking range lies between 28 and 50 V.

Do microinverters affect grid performance?

Since the application of microinverters is concentrated in small-size PV systems, their effect on the grid output quality would be insignificant. However, as the microinverter systems are being disseminated and applied for large systems their effect could be significant on the grid performance.

How can a grid-connected inverter achieve optimal power quality coordinated control?

Next, to ensure the grid-connected inverter achieves optimal power quality coordinated control with minimal compensation capacity, an optimization compensation function is established between compensation capacity and comprehensive power quality index.
